ART UNIT

PAPER NUMBER

1765

7

DATE MAILED: 04/10/2002

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

09/820,692

Applicant(s)

CHIEN ET AL.

Examiner

Kin-Chan Chen

Art Unit

1765

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☐ Responsive to communication(s) filed on ____.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-20 is/are pending in the application.
- 4a) Of the above claim(s) ____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) ____ is/are allowed.
- 6) ☒ Claim(s) 1-20 is/are rejected.
- 7) ☒ Claim(s) 1-3 and 19 is/are objected to.
- 8) ☐ Claim(s) ____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on ____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on ____ is: a) ☐ approved b) ☐ disapproved by the Examiner.
If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. ____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
* See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892) 4) ☐ Interview Summary (PTO-413) Paper No(s). ____
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948) 5) ☐ Notice of Informal Patent Application (PTO-152)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449) Paper No(s) 4, 6. 6) ☐ Other: _____

DETAILED ACTION

Claim Objections

1. Claims 1-3 and 19 are objected to because:

In claim 1, line 5, it contains a typographic error, "ti" should be --to--.

In claim 2, line 3, the examiner suggests deleting "(SAC)" because it might have several meanings.

In claim 3, line 2, it contains a typographic error, "ia" should be --is--.

In claim 19, line 4, it contains a typographic error, "tyhe" should be --the--.

Appropriate correction is required.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-5, 9-12, and 14-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hung et al. (US 6,174,451 B1) in view of Wang et al. (US 6,074,959).

Hung teaches a method of etching a dielectric layer (e.g., oxide layer) with selectivity to an underlying stop layer. A semiconductor substrate is supported in a

Art Unit: 1765

plasma etch reactor. The substrate including a dielectric layer (e.g., oxide layer) over a stop layer (col. 2, lines 24-31; Figs 1 and 2). An etchant gas may be supplied to the plasma etch chamber. Etching openings may be performed in the dielectric layer (Fig. 1) by energizing the etchant gas into a plasma state. The etchant gas may comprise a hydrogen-free fluorocarbon gas represented by C_xF_y gas wherein $y/x \leq 1.5$ (such as C_4F_6) and carrier gas (such as Ar). See col. 7, TABLE 1, first etch recipe and col. 7, lines 33-56.

Unlike the claimed invention, Hung does not teach that an oxygen-containing gas may be incorporated in the etchant gas for oxide layer (dielectric layer) etching. In a method of plasma etching openings of dielectric layer with high selectivity of dielectric to the silicon nitride, Wang teaches that fluorocarbon may be used (Fig 1; col. 9, lines 42-47). The process may be modified by the addition of carbon monoxide, nitrogen, or oxygen, all of which are known to enhance selectivity and increase the etch stop margin (col. 10, lines 23-26). Hence, it would have been obvious to one with ordinary skill in the art to modify the etchant gas of Hung by adding oxygen as taught by Wang because Wang teaches that to do so will enhance selectivity and increase the etch stop margin.

As to dependent claim 2, Hung teaches these structures (col. 11, lines 11-30).

As to dependent claim 3, Hung teaches that the stop layer may be silicon nitride and the etch rate selectivity of the dielectric to the silicon nitride is at least 10 (col. 7, lines 50-56).

As to dependent claim 4, Hung teaches doped or undoped silicon oxide layer (col. 1, lines 27-33).

Art Unit: 1765

As to dependent claim 5, Hung teaches the limitation (col. 3, lines 12 and 18).

As to dependent claim 9, 10, 16, and 17, the combined prior art (Hung and Wang) teaches C_xF_y gas (such as C_4F_6) and oxygen. Hung and Wang are relied on for the same reasons as stated, *supra*. The combined prior art does not teach the ratio of flow rates of the said fluorocarbon to oxygen. The instant claims differ from the prior art by teaching the ratio of flow rates of the said fluorocarbon to oxygen (such as 0.5:1 to 5:1 in claims 9 and 16; 1:1 to 2:1 in claims 10 and 17). However, same is known to be result-effective variable, it would have been obvious to one of ordinary skilled in the art to determine the suitable ratio of flow rates through routine experimentation in the combined prior art in order to produce the best etched product achievable.

As to dependent claim 11, Hung (col. 8, Table 2, main etch) teaches that pressure in the plasma etch reactor may be 10 mTorr and temperature of the substrate support (e.g., cathode temperature) may be 15 °C, which is within the claimed range.

Dependent claim 12 differs from the combined prior art by specifying the different process parameters (pressure of reactor and temperature of the substrate support). However, Hung teaches that the process parameters may vary and dependent on different commercially available plasma reactors (col. 11, lines 43-44). Furthermore, same were known to be result-effective variables, it would have been obvious to one of ordinary skilled in the art to determine the optimum, operable range of process parameters (e.g., pressure of reactor and temperature of the substrate support) for different commercially available plasma reactors in the combined prior art in order to provide their art recognized advantages and produce an expected result.

Art Unit: 1765

As to dependent claim 14, Wang teaches that fluorocarbon may be used (Fig 1; col. 9, lines 42-47). The process may be modified by the addition of carbon monoxide (CO), which is known to enhance selectivity and increase the etch stop margin (col. 10, lines 23-26). Hence, it would have been obvious to one with ordinary skill in the art to modify the etchant gas of Hung by adding carbon monoxide as taught by Wang because Wang teaches that to do so will enhance selectivity and increase the etch stop margin. The combined prior art does not teach that the rate of 50 to 500 sccm CO may be supplied to the etch reactor. However, same is known to be result-effective variable, it would have been obvious to one of ordinary skilled in the art to determine the suitable ratio through routine experimentation in the combined prior art in order to produce the best etched product achievable.

As to dependent claim 15, Hung teaches C_4F_6 (col. 7, line 4).

As to dependent claim 18, in order to complete the etching of the openings, keeping an amount of etchants (e.g., C_4F_6 and oxygen) sufficient to avoid etch stop is considered inherent in the method of combined Hung and Wang. Hung and Wang are relied on for the same reasons as stated, *supra*.

As to dependent claims 19 and 20, Hung teaches that the dielectric layer (oxide layer) may be BPSG (col. 1, lines 32-34) and the stop layer may comprise silicon nitride (col. 2, lines 29-30). The etch rate selectivity of the oxide layer (e.g., TEOS) to the corner portion of the silicon nitride may be 20 (col. 7, lines 51-56). The combined prior art (Hung and Wang) teaches C_xF_y gas (such as C_4F_6) and oxygen. Hung and Wang are relied on for the same reasons as stated, *supra*. The combined prior art does not teach

Art Unit: 1765

the etch rate selectivity of the BPSG to nitride and the ratio of the flow rates of O_2 : C_4F_6 . The instant claims differ from the prior art in the etch rate selectivity of the BPSG to nitride (e.g., at least 15 in claim 19) and the flow rates having a ratio of O_2 : C_4F_6 (e.g., 0.5 to 1.2 in claim 20). However, the ratio of the flow rates of O_2 : fluorocarbon is known to be result-effective variable; it would have been obvious to one of ordinary skill in the art to determine the suitable flow rate ratio of O_2 to C_4F_6 through routine experimentation in the combined prior art in order to produce the best etched product achievable and desired etch rate selectivity.

4. Claims 6-8 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hung et al. (US 6,174,451 B1) and Wang et al. (US 6,074,959) as applied to claim 1 above, and further in view of Schmitt (US 6,228,438 B1).

The discussion of modified Hung and Wang from above is repeated here.

Hung teaches that his oxide etching process (with nitride stop layer) may use commercially available plasma reactors (col. 11, lines 43-44). Therefore, it would have been obvious to one with ordinary skill in the art to use popular commercial available plasma reactors. Schmitt is relied on only to teach one of the popular commercial available plasma reactors with dual frequency capacitively coupled plasma reactor including an upper showerhead electrode and a bottom electrode as claimed (see col. 1, line 15-17; col. 8, lines 1-12). Hence, it would have been obvious to one with ordinary skill in the art to use the popular commercial available plasma reactors as disclosed by

Art Unit: 1765

Schmitt in the process of Hung and Wang in order to provide their art recognized advantages and produce an expected result.

As to dependent claims 7 and 8, Hung (col. 7, TABLE I, first etch recipe) teaches that the flow rates of 20 sccm C_4F_6 and 100 sccm Ar may be used, which is within the claimed range. Hung, Wang and Schmitt are relied on for the same reasons as stated, supra. The combined prior does not disclose the flow rate of oxygen (O_2) for the process. However, same is known to be result-effective variable, it would have been obvious to one of ordinary skilled in the art to determine the suitable flow rate of oxygen (O_2) for the process through routine experimentation in the combined prior art in order to produce the best-etched product achievable.

As to dependent claim 13, Hung, Wang and Schmitt are relied on for the same reasons as stated, supra. The combined prior art does not disclose the range of RF energy being supplied into the process. The instant claim differs from the combined prior art by specifying showerhead electrode and bottom electrode being supplied 0 to 3000 watts of RF energy. However, it is merely a matter of choice of engineering depending on product requirement. One skilled in the art at the time of the invention would have found it obvious to apply engineering practice to determine the range of RF energy suitable for the process and the specific product requirement in order to provide their art recognized advantages and produce the best-etched product achievable.

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kin-Chan Chen whose telephone number is (703) 305-

Art Unit: 1765

0222. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Benjamin Utech can be reached on (703) 308-3836. The fax phone numbers for the organization where this application or proceeding is assigned are (703) 872-9310 for regular communications and (703) 872-9311 for After Final communications. Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 308-2934.
